

TeraStation selection

[TS-WXL](#)

Recent LinkStations have been hacking away, including the inability to attach a serial console and the hassle of allowing them to telnet

According to Mr. K of Company I, a serial console must not be attached to receive (?) DTCP-IP certification.

That's why recent LinkStations that support DTCP-IP have become harder to use as Linux Boxes.

So where do you play next? When that happens, I wonder if there may be a choice of TeraStation.

The TS-X series would be the same 1.2GHz CPU as the LS-XHL, etc.,

and unlike the LS-QL, it is attractive because it can also support hot swapping.

I'm afraid to use TeraStation in a company, but if I play it alone I wonder if it's a good choice except for a little expensive.

[Long](#) ago, I got [TS-WX1.0TL / R1](#)

It was a good thing to get Genshiba.

It's a new year, and I'm about to start playing.

Here, "Let's hack LinkStation / KuroBox". . .

[Rakuten Ichiba](#)
